P R E F A C E

In this book the tables from V.S. 57 to V.S. 2100 have been given to enable the scholars of Indian History to convert readily the dates of Hijri and Vikram era to Christian era and vice versa. The corresponding years of (a) Saka era from 1 to 1986 (b) Christian era from A.D. 1 to A.D. 2044, and (c) Hijri era from 1 to 1466 have been shown in the second, fourth and fifth columns. The additional and suppressed months of Vikram and Saka eras are mentioned in the third column. The fourth column shows the day and date of the Christian era on the beginning day of the Vikram and Saka era i.e. *Chaitra Shukla Pratipada* (one). From page 9 onwards, in the fifth column is given the month of Hijri era starting either on *Dvitiya* (Second) or *Tritiya* (Third) *tithi* (date)-according to the visibility of the moon—of *Chaitra Shukla*. The month of Hijri era starts on the visibility of the moon in the sky on the evening of either *Pratipada* (First) or *Dvitiya* (Second), but in the calendars it is recorded on *Dvitiya* or *Tritiya*. For example, the crescent moon was visible on 29th march 1979 and the month *Jamadi awwal* 1399 started on that evening but in calendars on 30th March, the first *Tarikh* (date) was recorded. Due to the non-visibility of the crescent moon on different places there can be a difference of a day in different calendars but this difference is eliminated in the next one or two months.

In the sixth column, the date of the Christian era of the first day of the *Muharram* (the first month of Hijri era) has also been recorded. The last (seventh) column shows the day, along with the month of Vikram era. The first *Tarikh* (date) of the Hijri era falls either on second or third *Tithi* of *Shukla Paksha* of the Vikram or Saka eras. The Month and *Paksha* of the Vikram and Saka are the same.

In the Introduction, I have given the method of calculating the dates of different eras. A list of solar and lunar eclipses have also been given as the eclipses have been often quoted in the old Indian records. All these were readily available to me from the archives of my grandfather (Late) Shri Jagadish Singhji Gahlot, the renowned Historian of Rajasthan. He prepared these for his book "Historical Calendar" (*Itihas Sahayak Panchang* (1582 A.D. to 2000 A.D.) Without these it would not have been easy for me to complete this book. My Father, Shri Sukhvir Singhji Gahlot, was constantly guiding me in this work.

I am thankful to Dr. K.S. Lal, Professor and Head of History Department, Jodhpur University for going through this book and writing a foreword to it.

I am sure with all care, some errors may have crept in and so I request the Scholars to point them out to me whenever they come to know of them. I am preparing Tables giving corresponding dates of the first of the months of Vikram, Christian and Hijri eras, and so their advice will help me a lot in one way or the other.

PROFESSOR AND HEAD
Dr. K. S. Lal

11th May 1979

FOREWORD

Historians and Research Scholars in History need data to help them in establishing exactly chronological sequences. This need arises chiefly because the ancient and Medieval historians have made use of Vikram, Saka, Hijri, Christian eras etc. The different dates belonging to different eras may cause great confusion if not properly understood and known in relation to one another. For this purpose cross-checking of various calendars is imperative, although, it may be admitted it is a Herculean task.

Miss Purnima Gahlot, the Grand-Daughter of Sri Jagdish Singh Gahlot, a historian of repute from Rajasthan, has made the task for the historians easy by preparing this Ready Reckoner. Her inheritance has stood her in a great way in doing this arduous work. I have every reason to hope that the students and Scholars of History will find this work very useful.

K. S. LAL

INTRODUCTION

In Indian History, the Christian, the Vikrami, the Saka and the Hijri eras are commonly used. The Christian Calendar, also called Gregorian Calendar was first introduced in India in the later half of the 18th Century and is widely used in official work. The Hindus of Northern India use Vikrami Calendar in business and for ascertaining and defining the dates of festivals and religious ceremonies. They also used the Vikrami era in ancient historical records viz. inscriptions, copper-plates etc. For the last one thousand and five hundred years the Vikrami era is widely in use. The Saka era has very much in common with the Vikrami era and is very popular in South India. It is invariably used in the horoscopes. The Muslims all over the world use Hijri era for their festivals and religious ceremonies. In the medieval age it was the official calendar of the Indian Central Government. The Muslim Historians made use of this era in their books.

In the ancient and the medieval period some regions of India used their own calendars, but some of their calendars have glided into grave and so for a student of Indian History, the knowledge of the most popular Calendars viz. Vikrami, Saka, Christian and Hijri eras is essential.

VIKRAMI ERA.

Vikramaditya of Ujjain, it is said, to commemorate his victory over the Sakas, started the Vikrami Era. This era began with the vernal equinox of the year 57 B.C. (25th February), or the end of the *Kaliyug* year 3044. It is used by all the Hindus in the Northern India except in Bengal. In North India the year starts with the first *tithi* (date) of Chaitra Shukla (end of March) but the second and the consequent months start with the first *tithi* of *Krishna Paksha*. The first month is only of 15 days. The last month of the year is Chaitra having *Krsna Paksha* of 15 days only. In Gujarat the year starts with the first of *Kartika Shukla*, which falls at the end of October. The months in Northern India are *Purnimanta* (ending on *Purnima*—fifteenth of *Shukla Paksha*), while in the South are *Amanta* (ending on *Amavasya*—the last day of *Krsna Paksha*). The thirtieth day, recorded both in the North and South India is *Amavasya*, even though the month ends on *Purnima*. The *Shukla Paksha* in North India calendar always precedes *Krisna Paksha* of South India i.e. they have first the *Krisna Paksha* and then *Shukla Paksha*, the *Shukla Paksha* of both being the same.

The following table will clarify it—

<i>Amanta</i>	<i>Paksha</i>	<i>Purnimanta</i>
Chaitra	Shukla Krsna	Chaitra Vaisakha
Vaisakha	Shukla Krsna	Jyestha
Jyestha	Shukla Krsna	Asadha
Asadha	Shukla Krsna	Sravana
Sravana	Shukla Krsna	Bhadra
Bhadra	Shukla Krsna	Asvina
Asvina	Shukla Krsna	Kartika
Kartika	Shukla Krsna	Margasirsa
Margasirsa	Shukla Krsna	Pausa
Pausa	Shukla Krsna	Magha
Magha	Shukla Krsna	Phalgun
Phalgun	Shukla Krsna	Chaitra

The months of the Vikrami era are lunar but they are adjusted with the solar calendar by having additional months. An average lunar year is of 354.3610 days but a solar year is of 365.2547 days and so there is a difference of about 11 days between the lunar and solar years, and so seven additional months are adjusted in a period of 19 years. Ordinarily *adhika* months occur once in 3 years. Some times a month is suppressed but it is on rare occasions, say once in 63 years but it may be as early as in 19 years and as late as in 141 years. Where there is a suppressed month in a year, there will be two additional months also within a period of 12 months.

The *tithi* (date) of this era is counted from sunrise but all *tithis* are not of the same duration. An average lunar month consists of 29.53059 days and to adjust the 30 *tithis* in a

month, the average period of a *tithi* comes to .984353 days. The motion of the moon is inconstant and so the duration of *tithis* always varies. Due to this, some *tithis* complete their period from one sunrise to another sunrise while some continue even after another sunrise. Some day there is no *tithi* while on some other days there are additional *tithis*. On an average a *tithi* is suppressed in 63 days 54 *ghatis* and 32 *pals* (63 days 21 hours and 49 minutes or 63.9089 days). Due to there being additional and suppressed *tithis*, in 1979 the following days will have the additional and suppressed *tithis*—

<i>Additional Tithi</i>	<i>Date</i>
Purnima of Magha	11th & 12th Februray
8th of Chaitra Shukla	4th & 5th April
13th of Vaisakha Shukla	9th & 10th May
4th of of Jyestha Shukla	29h & 30th May
10th of Asadha Shukla	4th & 5th July
1st of of Sravana Shukla	24th & 25th July
11th of Bhadra Krsna	16th & 17th September
Amavasya of Karttika	20th & 21st of October
8th of of Pausha Krsna	11th & 12th of December

<i>Supperssed Tithis</i>	<i>Date</i>
3rd Magha Shukla	30th January
12th Phalgun Krsna	23rd February
2nd Chaitra Shukla	29th March
10th Vaisakha Krsna	21st April
14th Jyestha Krsna	24th May
6th Asadha Krsna	15th June
11th Asadha Shukla	5th July
9th Sravana Krsna	17th July
2nd Bhadra Krsna	9th August
5th Asvin Krsna	10th September
13th Asvin Shukla	3rd October
6th Karttika Shukla	26th October
11th Margsirs Shukla	29th November
6th Pausha Shukla	24th December

In 19 years there are 7 additional months and so when there are 2 months of the same name in a year, the first month is called *adhika* month and the second *nija* month. In 1980 A. D. (V. S. 2037) there will be an additional month of Jyestha. The first month of Jyestha from 1st May to 29th May, 1980 will be called *Adhika Jyestha*, the second Jyestha will be from 30th May to 23th June, 1980 and it will be called *Nija Jyestha*.

The names of the months of Vikrami and Saka eras are the same. The names are—Chaitra, Vaisakha, Jyestha, Asadha, Sravana, Bhadrpada, Asvina, Karttika, Marg Sirsa,

Pausha, Magha, and Phalgun. Every month has two *pakshas* (fortnights), one called *Shukla* (bright half) and the second called *Arsha* (dark half). The year starts with the first of Chaitra of *Shukla Paksh*, both in North and South India but the other months start with the first of *Shukla Paksha* in the South and with the first of *Arsha Paksha* in North India. In Gujarat the year starts with the first of Kartika of *Shukla Paksha*.

SAKA SAMVAT

The Sakas after conquering Bactria in 123 B.C. introduced this era to commemorate their accession to power. This era was also called Azes Era after the name of their leader for about 200 years. The Sakas after conquering a part of Northern India and having settled here were influenced by Indian Culture. They began using the names of Indian months and omitted the first 200 years of their era. It is said that King Kanishka started this era with the beginning of his reign in 78 A.D. This word 'Saka Samvat' was first used by Varahamihir in his treatise, *Pancha Siddhantika*—Saptashwa Veda (427) Sankhya Shaka kalmpasya Chaitra Shuklada. The reckoning of the Saka era began with the vernal equinox of A.D. 79. It is a luni-solar Calendar. The year begins with the first *Shukla Paksha* of Chaitra and its months are *amanta* (ending with *Amavasya* the ending day of the moon) but in Bengal it is generally used with the Solar Calendar. In the Luna Solar reckoning the months are *Purnimanta* (ending with *Purnima*) in the North and *Amanta* in South India.

For converting Saka dates into Christian ones, 78 years are added to the given year and for converting into Vikrama era dates, 13 years are added to the given years. This era is extensively used over the whole of India except in the far South.

HIJRI SAN

All the Islamic countries have taken recourse to the Hijri San which is adhered to by the Muslims for religious purposes. The word '*Hijrah*' literally means 'departing from one's country and separation from friends'. Hijri era derives its name from the flight of the Prophet from Mecca to Madina (20th September, 622 A.D.) i.e. 8 of Rabi' Awwal. For calendar purposes the era began with the visibility of the crescent moon of the first month of Muharram i.e. Thursday, July 15 of 622 A.D. As the day of the Islamic calendar commences from the visibility of the moon the first day starting the year was Friday, 16th July 622 A.D.

The first Caliph Umar decided in the Ramzan of Hijri year 17 to introduce this era to commemorate the flight of Prophet Mohammed from Mecca. Since the era is lunar and starts with the visibility of the crescent moon the month starts with the first or second tithi of *Shukla Pausha* of the Vikrama Era.

In this Record Reckoner the month of the Hijri era falling on second or third tithi of Chaitra Shukla has been given in column 5 from Page 9 to 40.

The Christian and Vikrami era calendars are solar and luni-solar respectively but as the Hijri Calendar is lunar only, its year starts from any month of solar or luni-solar calendar. A lunar year is of 354 days 8 hours and 48 minutes and so the average number of days for each month comes to 29 days 25 hours and 44 minutes. A solar year is of 365 days, 5 hours and 49 minutes and thus a Hijri year falls short of 10 days, 21 hours and 1 minute. This results in an increase of about 11 days in a year, and of one year after every 33 years. Thus on 25th November, 1946, the Muharrama of 1366 H.E. started and on 21st November, 1979 (33 solar years) the Muharram of 1400 (34 lunar years) will start.

Hijri months are Muharram, Safar, Rabi-ul-awwal, Rabiussani or Rabi Akhar, Jamad'l awwal, Jamadul Akhar, Rajab, Shaban, Ramzan, Shawal, Zilkada and Zilhijja. The month starts with the visibility of the crescent moon and so the months are either of 30 or 29 days. For astronomical and chronological purposes the lengths of the months are defined by rule and not by observation. The length of each month in days for this purpose is as follows:—

- | | |
|----------------------|-----------------------|
| 1. Muharram 30 | 2. Safar 29 |
| 3. Rabiulawwal 30 | 4. Rabiussani 29 |
| 5. Jamada'l awwal 30 | 6. Jamadul Akhar 29 |
| 7. Rajab 30 | 8. Shaban 29 |
| 9. Ramzan 30 | 10. Shawwal 29 |
| 11. Zilkada 30 | 12. Zilhijja 29 or 30 |

In leap years, Zilhijja has one day more and that year there are 365 days. In a cycle of 30 days there are 11 leap years. That year of Hijri era, which when divided by 30, leaves a remainder of 2, 5, 7, 10, 13, 16, 18, 21, 24, 26 or 29 is called a leap year.

Since the Hijri era depends on the visibility of the crescent moon, there might be a difference of a day, sometimes due to non-visibility of the crescent moon on account of clouds in the sky at different places.

After every 19 years of Hijri era the same date falls with a difference of a day only viz. on 1st Muharram 1399 (2nd December, 1978) it was Saturday, and so on 1st Muharram 1418 (9th May, 1997) it will be Friday. After every 133 years, the day falls on the same date viz. Muharram 1 of 1399 (2nd December, 1978), it will be Saturday, and on Muharram 1 of 1266 (17th November, 1849) it was Saturday (the visibility of the crescent moon may make the difference of a day sometimes).

It must be noted that when a Historian, specially a Muslim, gives dates in Hijri era, and writes that a certain event happened on the night of Rajab 2 of 122 Hijri (2nd June 740 A.D.) it means that the event may have happened between sunset and midnight of 1st June 740 A.D. or between midnight and dawn of second June 740 A.D.

ECLIPSES

There is a solar eclipse when the Moon passes between the Sun and the Earth blocking out the Sun's light. When the Moon passes into the shadow of the Earth its supply of sunlight is cut off and a lunar eclipse occurs. A solar eclipse always occurs at new moon (*amavasya*), and a lunar eclipse at a full moon (*Purnima*).

Historical records mention the exact dates of the eclipses and the events associated with them. In various Indian Historical documents eclipses have been freely cited, and so the list of solar and lunar eclipses of the Vikrama Era (57 to 2100) has been recorded :

Rajab Shaban Ramzan Shaban Zilkada Zilhija Muharram Safar Rabi I Rabi II Jama I Jama II	Shaban Ramzan Shawal Zilkada Zilhija Muharram Safar Rabi I Rabi II Jama I Jama II Rajab	Ramzan Shawal Zilkada Zilhija Muharram Safar Rabi I Rabi II Jama I Jama II Rajab Shaban	Shawal Zilkada Zilhija Muharram Safar Rabi I Rabi II Jama I Jama II Rajab Shaban Ramzan	Zilkada Zilhija Muharram Safar Rabi I Rabi II Jama I Jama II Rajab Shaban Ramzan Shawal	Zilhija Muharram Safar Rabi I Rabi II Jama I Jama II Rajab Shaban Ramzan Shaban Zilkad

CALCULATION OF DATES ETC. OF DIFFERENT ERAS

For calculating the dates it is essential to have a basic tithi whose correct Christian era date and day is known. For this purpose we take Friday, Pausha Shukla 15 of V.E. 2028. On this day the Purnima tithi completed its duration at about midnight and the first tithi of the month of Magh started and at the same time the 31st of December 1971, also ended, giving birth to the new year of 1972.

To find out any C.E. date from V. E. date count the days, months and years from or to the basic date. Also count the additional V.E. months falling during this period. Add them to complete days to know the days before or after the basic tithi. If the day of the required tithi is known, confirm it from the basic tithi. If there is a difference of a day, presuming the day to be correct, add or subtract from the total number of days. If there is a difference of 2 days or more, then take it that the known day is incorrect. From the basic date of C.E. count the days by adding or subtracting and find out the C.E. day.

Example—Find out the day and date of Kartika Krsna 30 of V.S. 2031.

The required tithi is 2 year 9 months 15 days after the basic date. As per Table XI (a) there are 2 additional months and so total period will be 2 lunar years, 11 lunar months and 15 tithis. As per Table XII there will be 1048.57 days. By dividing these by 7 we get 5 as remainder and so as per Table XIII it is Wednesday.

In 2 years after basic date as per Table XIV there are 731 days. Deducting these from 1048.57 we get 317.57 days. These are the lapsed days of 1974 A.D. Upto the end of October there are 304 days and so the remaining 13 days mean 13th of November.

Example—Find out the date of V.E. 1925 Bhadra Krsna 12, Saturday for Kathiawar (Gujarat)

In Kathiawar, Vikrama era is Karttikadi and months are amanta and so the date for Chaitradi year is V.E. 1926 and month Asvin. From basic date it is 102 years 3 months 18 tithis. The additional month Vaisakha of V.E. 1926 passed before our required date, and so we had 37 additional months only (Vide Table XI(a)) and 105 lunar years, 4 lunar months and 18 tithis. As per Table XII we had 37344.66 days. By dividing these days by 7 we get 6 as remainder and so as per Table XIII it is Saturday (the correct day). It is now certain that 37344 days passed before our basic date. As per table XIV in 103 (100+3) years there were 37620 days but as 1900 was not a leap year, deduct 1 day and so we had 37619 days. Deduct 37344 days from 37619 and we have 275 days. Upto September 30, there are 273 days (Table XV) and so 2nd October is the required date.

Finding out a day of month of Christian era

(1) The years above a century figures may be divided by 4 and the multiple may be added to it.

- (2) The century year figure may also be divided by 4 and the remainder be multiplied by five the resultant figure is to be kept separately
 (3) The figures of the months are taken as shown below—

January 0 February 3 March 3 April 6, May 1, June 4 July 6 August 2 September 5 October 2 November 3 December 5

In leap years the week day of January and February falls one day earlier

- (4) The required day of the date is added to resultant of (1) (2) and (3)
 (5) Divide it by 7 and you will get the number of day
 (6) If the day of old style calendar is to be ascertained add 2 more to the century figures and subtract whole of it from (1)

For converting a day or date from Vikrami era date or Christian era date to Hijri era date we have to count lunar years months and dates between the required date and the basic date i.e. to deduct if it is before basic date and to add if it is afterwards from 1391 years 11 months and 13 days The resultant will be the date the month and year of the Hijri era

*Example—*Find out the Hijri date of 15th August 1947

From the end of 1946 to 1971 for 25 years the total days are 9131 days The days from first January to 15th August are 227 Deduct these 227 days from 9131 and we get 8904 days From Table XII we get for 25 lunar years and 1 lunar month 8898 70 days Now remains 15 20 days and this is From Table XV we get the nearest tithi as 14th or 15th of Krishna Paksha So it was 14 of Krishna Paksha of II Sraavan of V E 2004

From Table XV III the corresponding date for 14 Krishna is 27

For finding month of Hijri year we have to deduct 25 lunar years 1 lunar month and 16 tithis from 1391 years 11 months and 13 days The result is 1366 years 9 months and 27 days and so we have 27th of 9th month (Ramzan) of H E 1366

*For ascertaining the Christian date from Hijri year the same method is to be followed—*Count the lunar years and dates from Hijri date to the basic date and then have the same calculation as we do for finding date of Christian era from Vikram era

Finding out a Vikram Era tithi from the given Christian Era date

By having reversed the process we can ascertain a Vikram era tithi from the given Christian era date but there is probability of difference of a day due to having an additional or suppressed tithi

For finding a Vikram era date the counting of the day may be done as per Table XIV from Christian era date to basic date From these days as per table XII all days of the lunar years and months are deducted. The remaining days which will be less than 30 days from Purnima—the Purnima being the basic tithi After finding out the difference of days from or we can know the tithi of Krishna Paksha or Shukla Paksha

Finding out Hijri dates corresponding to Christian dates, deduct 622 from C.E.; the remainder be multiplied by 1.0307. Add .46 to the resultant. The sum (whole number) will be the Hijri year. The figure after the decimal be multiplied by 354. This will give the number of days of the first of Muharram of Hijri era from the first of January of C.E.

Example—Work out Hijri year and date of 25th December 1697

$$1697 - 622 = 1075$$

$$1075 \times 1.0307 = 1108.0025$$

$$1108.0025 + .46 = 1108.4625 \text{ (H.E. 1108)}$$

$$.4625 \times 354 = 163.72$$

Counting the days of each month from Muharram (30), Safar (29), Rabiul Awwal (30), Rabi-Akhar (29) Jamadi awwal (30) and Jamadi Akhar (15), we come to 163 days. Thus on first January 1697 A.D. it was 16th Jamadi Akhir of 1108 H. E. From first January 1697 to 25th of December there were 359 (365-6) days. The remaining days for H. E. 1108 are 191. After that we have to count $359 - 191 = 168$ days and so the days of Muharram 30, Safar 29, Rabi awwal 30, Rabi Akhar 29, Jamadiawwal 30 and Jamadi Akhir 20 give a total of it (168 days). So it is 20 Jamadi Akhir of H.E. 1109.

For ascertaining the date according to new style calender i.e. for years after 1752 A.D. deduct 622 from C.E and multiply the remainder by 1.0307 and add .43703 to the resultant. Then adopt the aforementioned procedure.

Example—Find out the date for 9th April 1958

$$1958 - 622 = 1336$$

$$1336 \times 1.0307 = 1376.9152$$

$$1376.9152 + .42918 = 1377.44438$$

i.e. 1377 is the Hijri year

$$.44438 \times 35 = 157.31052$$

Counting 157 days from Muharram 30, Safar 29, Rabi awwal 30, Rabi Akhar 29, Jamadi awwal 30 and Jamadi Akhar 9 (Total 157) we find that Jamadi Akhar corresponds with January 1. From January 1 to 9th April there are $(31 + 28 + 31 + 9)$ 99 days. From Jama Akhir 9 add 99 days (Jama Ahkar 21, Rajjab 30, Shaban 29 and Ramzan 19) and so the required date is 19th Ramzan of H. E. 1377.

For converting Hijri era dates to Christian era dates, subtract .46 (for old style) and .43 (for new style) from Hijri era and the remainder be divided by 1.0307 upto 3 decimals. Add 622 to the remainder and get the year of C.E. The figure after decimal be multiplied by 365.25 and get the date and the month.

Example—Find out the date of 1 Ramzan 1079 H. E.

$$1079 - .46 = 1078.54$$

$$1078.54 \div 1.0307 = 1046.415$$

1046 415 + 672 = 1668 415 (1668 is the C.E. year)
 —415 = 365 25 = 151,57875

On completion of 1668 it was June 1 and it was Muharram 1 of 1079 H.E. From Muharram 1 to Ramzan 1 there are 236 days and so add 236 days to June 1 and we get January 22 of 1669 C.E.

Example—Find out C.E. date of Jamadī awwal 1 of 1408 H.E.

$$1408 - 43 = 1407 \text{ 57}$$

$$1407.57 - 10307 = 1365 \text{ 644}$$

$$1365 \text{ 644} \times 622 = 1987 \text{ 64 (1987 is the C.E. year)}$$

$$64 \times 365 \text{ 25} = 235 \text{ 2210}$$

On completion of 235 days i.e. on August 24 was Muharram 1. Upto Jamadī awwal 1 will be 119 days and so 119 days from August 24 will be December 20 of 1937 C.E.

Finding out day from the Christian era date

For ascertaining the date of the centuries preceding 1752 A.D. divide the century year by 400 (column 5 to 11 of Table XVI) and for subsequent century years divide by 400 (Column 12 to 15) the remainder will be found in respective columns (1 to 4) of years of the century (See Table XVI).

To find the date of a year see the word indicating week days in the respective column (12 to 15). If there are two words the first word is for January and February and the second word is for the rest of the months. For finding the week day and date of the month go down towards the column of the week day index (Table XVII) from which the day has started. To its left will be the dates. To find the day of that date see the day in the column opposite to the date.

Example—Find the day of 26th January 1950. Divide 1900 by 400. The remainder is 300. For finding word of 50 see opposite column 300 and there word is H. Now see the table XVII and Thursday. Thus on 26th January 1950 the week day was Thursday.

Another Methods

For century years the figures are—

0 for 600 & 1300

1 for 1200 & 1600

2 for 1100 & 1900

3 for 1000

4 for 900 & 1800

5 for 800 & 1500

6 for 700, 1400 & 1700

For months the figures are May—0, August and February (leap year)—1, February, March and November—2, June—3, September and December—4, April, July and January of the leap

year—5 : and January and October—8. For week days—Sunday 1, Monday 2, Tuesday 3, Wednesday 4, Thursday 5, Friday 6, and Sunday 0,

For finding out day for the required year take the last 2 figures and multiply by 1.25. Add to it figure of the month. Add the figure of date also : After adding all of them, divide the sum by 7, and you will get the week day.

Example—Find out the day for 21st January 1979

For 1900 the figure is	2
For 79×1.25 (98.75) the figure is	98
For January the figure is	6
For date	21
Total	127

On dividing 127 by 7, we get remainder 1 i.e. Sunday.

Table V
Number of Days in The Christian Year

Day of Month	January Day of Year	February Day of Year	March Day of Year	April Day of Year	May Day of Year	June Day of Year	July Day of Year	August Day of Year	September Day of Year	October Day of Year	November Day of Year	December Day of Year
1	1	32	60	91	121	152	182	213	244	274	305	335

				500	177183·6000

TABLE XIII

Confirming Week-days

The remaining days obtained (from Table No. XII) from given tithi and basic tithi be divided by 7. The remainder number will be the week-day as shown below :

Remaining Number	0	1	2	3	4	5	6
Day before basic date	Fri.	Thur.	Wed.	Tue.	Mon.	Sun.	Sat.
Day after basic date	Fri.	Sat.	Sun.	Mon.	Tue.	Wed.	Thur.

If the day of the required tithi does not tally with the day of this table, presume the day to be correct and adjust the tithi. The maximum difference between the ending of the tithis is 15 hours or $\frac{1}{2}$ day and as that tithi is counted which is prevalent at the time of sunrise, even though if it ends just after sunrise and the next tithi starts, there can be a difference of a day only.

TABLE XIV

Number of days of years (including leap years) of Christian Era

Years	Days from Basic Date (31 12 1971)		Days from Basic Date	
	Earlier Years	Subsequent Years	Years of earlier and subsequent years	
1	365	366		
2	730	731	20	7305

11	9	11	24
12	10	12	25
13	11	13	26
14	12	14	27
15 (Purnima)	13	30 (Amavasya)	28

If the crescent moon is visible in the evening of the first (Pratipada) tithi of Vikrama era the day following i.e. on the Second (Dvitiya) tithi of Vikrama era date will be first of Hyri era. If evening of the Second (Dvitiya) tithi of V E the parallel date to the third (tritiya) tithi will be the first date of H E. Thus there can be a difference of a day and it all depends on the visibility of the moon. Generally the moon may be visible on the first tithi (pratipada) if it lasts for 10 hours to 11 hours 48 minutes between equinox of March and September and for 8 hours 48 minutes to 9 hours 36 Minutes between equinox of the rest of the months. Otherwise the moon will be visible on the second tithi (Dvitiya). If the first tithi lasts between 14 hours 12 minutes to 15 hours 36 minutes between equinox of March and September and between 12 hours 48 Seconds to 13 hours 26 minutes in the rest of the months the moon will be visible on the second tithi only.

N.B.—In 1582, Pope Gregory XIII corrected the Julian Calendar and from 1583 onwards Christian dates are given in the New or Gregorian style. If it be desired to alter them to the old, or Julian Style, which was in use in England until 1752, ten days must be added to dates from 1583 to 1699 inclusive and 11 days from 1699 to September 2, 1752.
